3 Stress

Stress falls on the first syllable.

4 Phonotactics

4.1 Word-initial consonant clusters

Words can begin with clusters of two or three consonants. In general, all the consonants in a cluster agree in their quality, i.e. either all are broad or all are slender. Two-consonant clusters consist of an obstruent consonant followed by a liquid or nasal consonant (however, labial consonants may not be followed by a nasal). In addition, /s^v/ and /ʃ/ may be followed by a voiceless stop. Three-consonant clusters consist of /s^v/ or /ʃ/ plus a voiceless stop plus a liquid.

4.2 Post-vocalic consonant clusters and epenthesis

Like word-initial consonant clusters, post-vocalic consonant clusters usually agree in broad or slender quality.

A cluster of /r^v, r^h/, /l^v, l^h/, or /n^v, n^h/ followed by a labial or dorsal consonant (except the voiceless stops /p^v, p^h/, /k, c/) is broken up by an epenthetic vowel /ə/. There is no epenthesis, however, if the

vowel preceding the cluster is long or a diphthong. There is also no epenthesis into words that are at least three syllables long.

Part III

Morphology

The morphology of Proto-Forest depends on what kind of vowel or consonant the word starts with. "SC" in the tables below refers to the word starting with a slender consonant. "BC" in the tables below refers to the word starting with a broad consonant. "SV" in the tables below refers to the word starting with a slender vowel. "BV" in the tables below refers to the word starting with a broad vowel.

1 Nouns

Nouns are classed into two genders: Masculine and Feminine. Masculine nouns are nouns that end in a broad consonant or vowel. Feminine nouns are nouns that end in a slender consonant or vowel. "Redup" in the tables below means to reduplicate the first syllable onto the start of the word.

When a noun possess's another noun, the possessee comes first. There is no indefinite article, but there is a definite article.
